## ABSTRACT

**Objectives:** Tonsillotomy with radiofrequency (RF) is one of the newest treatments for chronic tonsillitis, but the mechanism of RF effects and complications are still pending. The aim of this study was to evaluate the effects of RF on the histological and bacteriological characteristics of the tonsils (Case-control study).

**Materials and methods:** In fifty-two patients with chronic tonsillitis in 2017–2018, immediately after tonsillectomy, the tonsils were divided into 2 sections; one sample treated with RF, and the other one considered as control, without intervention. All tonsil samples sent for histological and bacteriological study: morphometric assays made by Digitizer software, and type of bacterial colonies identified by microbiological and biochemical tests. Wilcoxon and McNemar tests were used for statistical analysis and level of significance was  $p \leq .05$ .

**Results:** Tonsil mucosal thickness ( $2202.98 \pm 323.09$  vs.  $2463.94 \pm 357.61 \mu\text{m}$ ) and size of the tonsil nodule ( $28,000.42 \pm 9608.75$  vs.  $36,692.81 \pm 7040.74 \mu\text{m}^2$ ) were significantly lower in the RF+ group than other group ( $p = .001$  and  $p = .01$ , respectively). There was no significant differences in thickness of the tonsil epithelium ( $p = .075$ ), number of lymphoid nodules ( $p = .860$ ), and the number of reticular tonsil epithelium ( $p = .813$ ) between the two groups. Bacterial growth in RF- and RF+ groups had no statistically significant difference ( $p = .06$ ), however, the average colony count of *S. aureus* in RF+ tonsils were significantly lower, and total number of bacterial colonies were significantly lower in RF+ group ( $1405 \pm 156$  vs.  $2471 \pm 156$ ), ( $p = .001$ ).

**Conclusion:** RF surgery has significant effects on size of the nodules, thickness of the mucous layer and bacteriological characteristics of tonsil tissue. Especially *S. aureus* seems to be more sensitive to RF effects.

## 1. Introduction

Tonsillitis is described as inflammation of the pharyngeal tonsils [1]. Bacteria such as *Haemophilus influenza*, *Streptococcus pneumonia*, viridans group Streptococci, *Staphylococcus epidermidis*, *Staphylococcus aureus*, *Chlamydia pneumonia* and *Mycoplasma pneumonia*, and many viruses such as respiratory syncytial viruses (RSV) a and b, influenza virus A and B (IVA, IVB), human Parainfluenza viruses 1, 2, and 3 (HPIVS), human adenoviruses (HADS), are common pathogens [2,3]. Typical symptoms of tonsillitis are sore throat, swallowing discomfort, painful lymph nodes in the neck; fever over 38 °C, headache, loss of appetite and bad breath. It may cause peritonsillar abscess [2].

Epidemiological studies show that more tonsillitis cases are seen in age group 6–12 years-old with 69% frequency [4]. Treatment of tonsillitis is possible using ibuprofen or acetaminophen with or without antibiotics. Surgical treatment that named tonsillectomy is also considered for patients with resistant and chronic tonsillitis [2]. Tonsillectomy is one of the most commonly performed surgical procedures worldwide [5,6]. In a report, 36.8% of tonsillectomy patients were younger than 12 years-old and 63.2% were over 12 years-old; 39.3% was male and 60.7% was female [7]. Also in UK Incidence of tonsillectomy was 4.2 per 1000 person in years [8]. There are different tonsillectomy techniques; including cold-knife tonsillectomy, monopolar and bipolar diathermy, cryosurgery, suction diathermy, bipolarscissor, KTP-532 laser, CO2
